

Setting Up Visual Studio Code (VSCode)

Zachery Crandall

Scientist I
Ames National Laboratory

PhD in Physical Chemistry
MS in Computer Science and Robotics

2026 SIMCODES Bootcamp

What is an IDE?

- IDE == Integrated development environment

```
"""Provides an implementation of the classic Hello World function."""

a_new_variable = ""

def hello_world() -> str:
    """A simple function that returns 'Hello World!'

    :returns: String containing 'Hello World!'
    :rtype: str
    """

    return Hello World!"
```

```
1  """Provides an implementation of the classic Hello World function."""
2
3
4  a_new_variable = ""
5
6  def hello_world() -> str:
7      """A simple function that returns 'Hello World!'
8
9      :returns: String containing 'Hello World!'
10     :rtype: str
11     """
12
13     return Hello World!"  SyntaxError: unterminated string literal (detected at line 13)
14
```

Installing VSCode

- Go to <https://code.visualstudio.com>
- Click “Download for Your_OS”
- Open the installer

Installing VSCode

Windows

- Make sure all “Open with Code” options are checked
- Finish and launch VSCode

MacOS

- Drag icon to “Applications”
- Open “Visual Studio Code” from Launchpad

- VSCode may prompt you to sign in to gain access to AI models/agents.
- Do so at your own risk.
- You are responsible for every line of code you commit to a repository.
- If you let AI develop for you, you must validate the results.
- Validation is nearly impossible unless you are experienced already.

Installing Python (Windows)

- Go to <https://python.org/downloads/>
- Click “Download Python install manager”
- Open the installer

Installing Python (Windows)

A screenshot of a Windows command prompt window titled "C:\Program Files\WindowsApps\PythonSoftwareFoundation.PythonManager_26.2.240.0_x64_3847v3x7pw1km\py-manager.exe". The window displays the "Welcome to the Python installation manager configuration helper." message, followed by a separator line of asterisks. It then informs the user that the global shortcuts directory is not configured. The text explains that configuring this allows running commands like python3.14.exe from the terminal, though it's not required for python or py commands. It offers to add the directory C:\Users\zachcran\AppData\Local\Python\bin to the PATH, noting that a restart is needed and the entry can be removed later. Finally, it asks for confirmation to add the directory to the PATH, with "[y/N]" as the input prompt.

```
C:\Program Files\WindowsApps\PythonSoftwareFoundation.PythonManager_26.2.240.0_x64_3847v3x7pw1km\py-manager.exe
Welcome to the Python installation manager configuration helper.

*****

The global shortcuts directory is not configured.

Configuring this enables commands like python3.14.exe to run from your
terminal, but is not needed for the python or py commands (for example, py
-V:3.14).

We can add the directory (C:\Users\zachcran\AppData\Local\Python\bin) to PATH
now, but you will need to restart your terminal to use it. The entry will be
removed if you run py uninstall --purge, or else you can remove it manually when
uninstalling Python.
Add commands directory to your PATH now? [y/N]
```

Installing Python (Windows)

```
*****  
You do not have the latest Python runtime.  
  
Install the current latest version of CPython? If not, you can use 'py install  
default' later to install.  
  
Install CPython now? [Y/n]
```

Testing your Python Install

- Open VSCode
- At the top, select “Terminal”, “New Terminal”
- Test the **interpreter**: Type “python” and press [Enter]

```
C:\Users\zachcran>python
Python 3.14.5 (tags/v3.14.5:5607950, May 10 2026, 10:43:50) [MSC v.1944 64 bit (AMD64)] on win32
Type "help", "copyright", "credits" or "license" for more information.
>>> print("Hello World!")
Hello World!
>>>
```

- Note: The interpreter is a place to quickly test individual functions and small scripts, but you should not develop code here!!!

Installing Extensions

- Search for “Python” in the extensions tab
- Install Python extensions (left)
- Install recommended extensions (right)

Testing your Development Environment

- Make a new folder named “hello_world”
- Open VSCode in that folder
- In VSCode, make a new file called “hello.py”

Testing your Development Environment

- Create and run the following code for a “Hello World” script

The screenshot shows the Visual Studio Code editor interface. The Explorer panel on the left shows a project named 'HELLO_WORLD' with a file 'hello.py'. The main editor area displays the contents of 'hello.py', which contains the following Python code:

```
1 def hello_world():  
2     return "Hello World!"  
3  
4  
5 if __name__ == "__main__":  
6     print(hello_world())  
7
```

The Run and Debug panel on the right is active, showing a play button icon. Below the editor, the TERMINAL panel is open, displaying the command to run the script:

```
$ /bin/python /home/zachcran/workspaces/work/projects/2026_SIMCODES/repos/hello_world/hello.py  
Hello World!
```

The terminal output shows the command being executed and the output 'Hello World!'. The status bar at the bottom indicates the file is at line 6, column 25, with 4 spaces, UTF-8 encoding, and LF line endings. The Python version is 3.14.5 64-bit.

Installing Python (macOS)

- Open VSCode
 - At the top, select “Terminal”, “New Terminal”
 - Install UV with the following command:
`curl -LsSf https://astral.sh/uv/install.sh | sh`
 - Install Python:
`uv python install 3.14`
-
- Windows can also install UV at this point with:
`pip install --user uv`
